## Digits

A sudden jump of Frederick Chopin Airports (EPWA) to the 1st Vatsim position on 11th November did not surprise me having in mind Vatsim stats observed from time to time. A large international event – Independence Day – weights significantly here. But I wondered when the same happened on Saturday, 26th November together with LOT VA internal real-ops limited to domestic traffic. Although LOT VA is the largest and the oldest Polish virtual airline, its real model – LOT Polish Airlines is just only a medium-size European airline. LOT domestic traffic means nothing in global scope so what happened that Saturday? I decided to look for proper metrics of our presence on Vatsim. The bottom line shocked me and it is worth to sharing with you.

Global statistics of real air traffic primarily indicate the number of passengers per airport. This is not comparable with virtual data, for obvious reasons. The second indicator is the number of operations at individual airport. This may be easily compared with Vatsim stats. Following ACCPL3 advice, I used official ULC (Civil Aviation Office) publications as the source of real aviation data from 2010. Excellent SAG stats pages provided preprocessed virtual data. I divided the number of virtual operations by the number of real operations per airport, obviously normalized to equal periods. Let me call this factor as „VATSIM To Real” (V/R). Expressed in percentages shows the extent to which the current virtual traffic represents the 2010 real traffic. Refer to footnotes for details on sources and calculations.

## Average number of operations on Vatsim monthly (Europe)

Table 1 presents the results for 25 busiest Vatsim airports in November 2011. November results are compared with the results from last 12 months to avoid mixing short with long term phenomena. No real data is provided for Ruzyne, Fuhlsbuettel and Ferihegy - being beyond the first hundred of the world airports, they are not listed by ULC. But these airports are bigger or comparable with Okęcie, definitely few times larger than Balice that enjoys similar virtual traffic. Therefore I did not look further. Innsbruck is obviously another case. Through Wiki I found its real data and added to the table, which made sense. In table 2 observe the results for all other controlled airfields in Poland as well as for uncontrolled Babice (present among Top 200 Vatsim Airports).

The final values of V/R factor shocked me. vFIR Warszawa is

unrivaled in the degree of virtual reflection of real traffic. Only Lawica, Strachowice and Szwederowo (but only in November) show one-digit V/R. All others reflect real traffic with two-digit factor and all - with the exception of Babimost - are listed among 200 largest Vatsim airports. Uncontrolled Babice in November had lower traffic than the annual average, however it ranked 144th among Vatsim airports, which is exactly the same position that Okęcie had in 2010 in the real world!

Outside vFIR Warszawa just only Innsbruck achieved similar

real traffic reflection. Gatwick, Athens and Lisbon had lower, but still two-digit results. Apart from table 1 I found also Istanbul with a two-digit value. One-digit result is a standard in Europe. Similarly in North America (table 3). I did not analyze other continents. Such a phenomenon is called overrepresentation. Polish virtual space is over-represented on Vatsim, with number of operations much higher than it would be expected in the global air traffic. PL-VACC managed to convince virtual pilots to fly to/from our airports at an unbeatable rate, much higher than the rate indicated by the real potential of the country.

ATC data (table 4) shows that similar overrepresentation also occurs in this area. It would be difficult to compare working hours with real data. But obviously the Polish airspace weighs very little in global traffic (although transit is greater than local operations). PANSAs (Polish Air Traffic Control Agency) is not a very small operator but certainly does not enjoy the position among the 10 largest such institutions of the world!

Traffic on Polish airfields as well as ATC services have been overrepresented on Vatsim for the last years. The phenomenon is growing. It is worth considering the reasons. Who and/or what caused and continue creation of so much interest in our virtual airspace? A few years ago I heard a simple explanation - „There is no IVAO in Poland”. If this text does not bore you, and the editors let me do it in the next section I try to convince you that there is single answer for both question - about the reasons for the lack of Polish IVAO, and about the reasons for the clearly over-representation of the Polish community on Vatsim.

PK\*

POLISH VIRTUAL AREA CONTROL CENTER

# Polish VACC

Polish VACC (Virtual Area Control Center) is an organization of virtual air traffic controllers. Our goal is to provide a real air traffic control to pilots using computer flight simulators. We do our best to make our virtual ATC world as real as the real world, so we use real world procedures, rules and publications. Polish VACC is proud to be a member of VATSIM-EUR region of VATSIM – world wide virtual air traffic network.

Just enjoy and see you over virtual Poland!

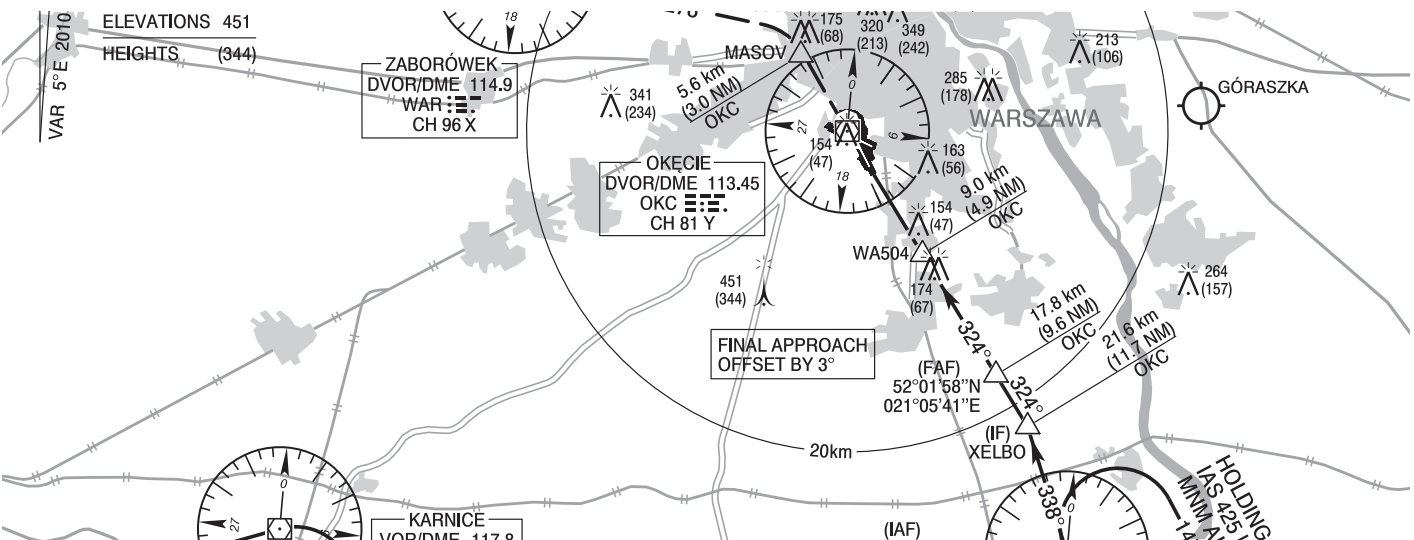

[pl-vacc.org](http://pl-vacc.org)

Cassubian Virtual Airlines (ICAO: CSB) were established in 2006 as a regional passenger and cargo carrier operating in the northern Poland. Initially, we were employing three pilots, and number of operations was below 25 per month. Today Cassubian VA, is one of the major carriers in Central Europe, with nearly 20 highly qualified pilots and more than 200 operations per month. The line has a very good reputation among pilots and controllers from different divisions. Cassubian VA actively participates in the development of Vatsim community. We:

- co-organize domestic and international events,
- run Cassubian Pilot School opened to every virtual pilot (we use one pilot – one coach teaching model),
- have found and publish monthly nationwide journal Virtual Pilot (21 issues since 2010),
- developed original system of staff management and operations quality measurement using statistic and economic models.

We invite you to visit us on [www.cassubian.pl](http://www.cassubian.pl).
